## NOTICES

When US Government drawings, specifications, or other data are used for any purpose other than a definitely related Government procurement operation, the Government thereby incurs no responsibility nor any obligation whatsoever, and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication or otherwise, as in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto.

Federal Government agencies and their contractors registered with Defense Documentation Center (DDC) should direct requests for copies of this report to:

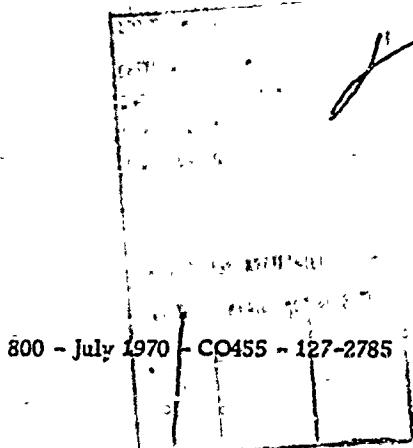

DDC  
Cameron Station  
Alexandria, Virginia 22314

Non-DDC users may purchase copies of this report from:

Chief, Storage and Dissemination Section  
Clearinghouse for Federal Scientific & Technical Information (CFSTI)  
Sills Building  
5285 Port Royal Road  
Springfield, Virginia 22151

Organizations and individuals receiving announcements or reports via the Aerospace Medical Research Laboratory automatic mailing lists should submit the addressograph plate stamp on the report envelope or refer to the code number when corresponding about change of address or cancellation.

Do not return this copy. Retain or destroy.

## **FOREWORD**

This report was prepared by the Anthropology Branch, Human Engineering Division, Aerospace Medical Research Laboratory, Wright-Patterson Air Force Base, Ohio. The research was performed in support of Project 7184, "Human Performance in Advanced Systems," Task 718408, "Anthropology for Design," and Work Unit 003, "Anthropometry."

The author is grateful to Mr. Charles E. Clauser, Lt. Col. Pearl E. Tucker, and Maj. Dora Duncan for their cooperation during the data collection phase of this study; to Mr. Edmund Churchill, Anthropology Research Project, Antioch College, and his staff for their help during the editing and analysis of the data; and to the David Clark Company, Worcester, Massachusetts, for permitting us to modify and construct a measuring board designed by their company.

The author is also indebted to Mr. Clauser and Dr. Melvin J. Warrick for their critical review of the manuscript.

The art work is by Mr. Jerome Ingram of the University of Dayton's Graphic Arts Department. The photographs were taken by Mr. James Weir of the Wright-Patterson Air Force Base Technical Photograph Department; models are Mrs. Lara Green and Mr. Milton Alexander.

This technical report has been reviewed and is approved.

C. H. KRATOCHVIL, Colonel, USAF, MC  
Commander  
Aerospace Medical Research Laboratory

## **SECTION I**

### **INTRODUCTION**

The Anthropology Branch, Aerospace Medical Research Laboratory, maintains a current and extensive anthropometric data bank on the USAF population and provides body-size data to the Air Force design engineers. This report contains a comprehensive compilation of data on the hands of the female component of the Air Force.

Since the latest published anthropometries of the Air Force population were 15-20 years old (ref. 1, 2), major anthropometric surveys of the male and female USAF population were recently conducted to maintain the currency and validity of the data for today's Air Force. The USAF male population was surveyed in 1967, and the USAF female personnel were surveyed in 1968. Although time and money considerations precluded taking all potentially useful anthropometric dimensions on the entire 1967-1968 sample, the specialized hand survey data covered herein was gathered in conjunction with the 1968 effort.

This report presents basic data, with some statistical analysis of the relationships between certain of these data. Application of the data to specific design problems is left to the design engineer.

## SECTION II

### THE HAND SURVEY

These data were collected at Lackland Air Force Base, Texas, in the summer of 1968 as an adjunct to the major anthropometric survey incorporating 137 physical dimensions of over 1900 Air Force females in the WAF, Nurse Corps, and Biomedical Science Corps. In addition to these 137 dimensions, a total of 56 measurements was secured on the

right hands of 211 females. The sample of 211 was not rigidly selected; instead, all subjects scheduled for the major survey effort on particular days were channeled to an extra measuring station for the hand measurements. The study sample does, however, compare favorably with the larger, major survey sample (see Table I).

**TABLE I**

| <i>Age</i>          | <i>Stature</i>        | <i>Weight</i>           | <i>Hand Breadth</i>   | <i>Circ., Meto-<br/>Hand</i> |
|---------------------|-----------------------|-------------------------|-----------------------|------------------------------|
| <b>USAF Females</b> |                       |                         |                       |                              |
| 1968 Survey N=1905  | 63.8 in.<br>(2.4 in.) | 127.3 lbs<br>(16.6 lbs) | 2.97 in.<br>(0.2 in.) | 7.2 in.<br>(0.4 in.)         |
| Means and (S.D.s)   |                       |                         |                       |                              |
| <b>USAF Females</b> |                       |                         |                       |                              |
| Study Sample N=211  | 64.0 in.<br>(2.6 in.) | 128.5 lbs<br>(18.0 lbs) | 3.03 in.<br>(0.2 in.) | 7.4 in.<br>(0.3 in.)         |
| Means and (S.D.s)   |                       |                         |                       |                              |

As far as possible the dimensions were selected to conform to certain of the hand dimensions presented in four previous Anthropology Branch publications—"A Sizing System for High Altitude Gloves" (ref. 3), "Nomograph of the Hand and Its Related Dimensions" (ref. 4), "X-Ray Anthropometry of the Hand" (ref. 5), and "Clearance and Performance Values For the Bare-Handed and Pressure-Suited Operator" (ref. 6). These four publications contain measurements obtained both by conventional anthropometric techniques on the fleshy exterior and through radiographs of skeletal segments of the hand. As X-Ray techniques were not used in the collection of the data herein, there can be no common reference to those dimensions in the aforementioned publications that were measured from points precisely located on the bones of the hand. Several of the previously presented dimensions have been carried further; to wit; the finger breadths and finger depths have been used in calculating finger circumferences. Finger circumferences, according to a prominent glove manufacturer, are more useful in the design of gloves than finger breadths and finger depths.

All measurements were secured on the 211

subjects' right hands. An excellent discussion of right hand vs left hand dimensions in "X-Ray Anthropometry of the Hand" (ref. 5, pgs 27-31) contains the following conclusions: The right hand tends to be slightly larger in both length and breadth dimensions than the left, with a majority of the differences statistically significant at the 1% level of confidence; the right hand evidenced slightly greater variability in lengths and less in breadths than did the left hand; and, inter-hand correlations on a dimension-by-dimension basis demonstrate a high degree of predictability from one hand to the other.

The wrist crease is the proximal baseline<sup>1</sup> for the measurement of the hand used throughout this report. This anatomical landmark has been used in previous anthropometry of the hand studies conducted by the author on selected Air Force samples (ref. 6 and unpublished data); by the U.S. Army Natick Laboratories on samples of Naval Recruit, Marine and Army populations (reports in preparation) and on the WAC (ref. 7). Other anatomical baselines used else-

<sup>1</sup>Here specifically defined as a line drawn tangent to the most proximal portions of the diploid flexure crease formed at the bases of the thenar and hypothenar eminences.

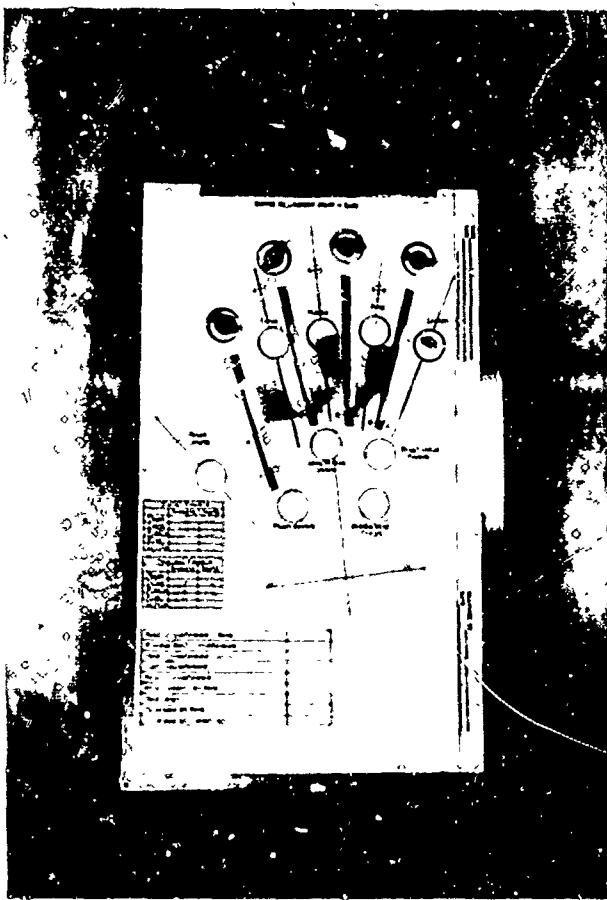

where include the proximal edge of the navicular bone (accurately determinable only through X-Rays (ref. 1-3, 8-16) ) ; stylion (the distal-most point on the styloid process of the radius, (refs. 17-18) ) ; the point where the thumb joins the wrist (ref. 19) ; and from the mid-point on a line connecting both stylia (radial and ulnar, (refs. 20-21) ). An exact determination of the correlative differences

of these techniques remains to be accomplished. However, an unpublished study by the author on a mixed male-female sample, N of 19, produced Hand Length means of 20.0 cm by measuring to the palpated navicular, 19.7 cm to the palpated radial stylion, and 19.4 cm to the wrist crease; a spread of 0.6 cm in the means between the three.

## **SECTION III**

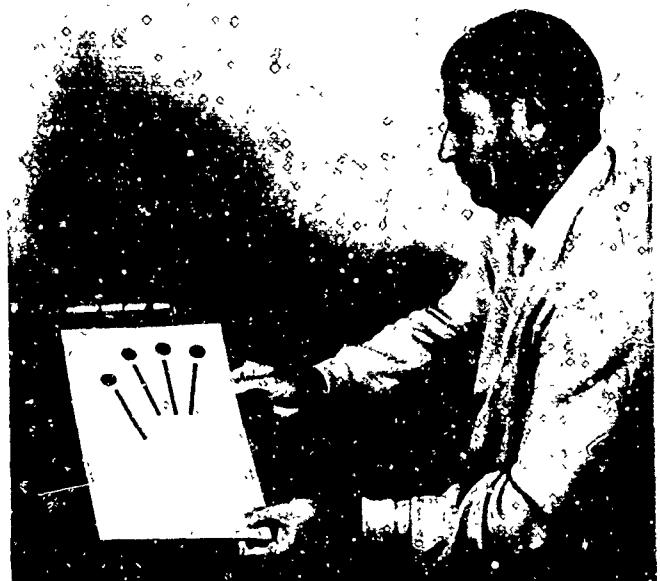

### **METHODS**

To expedite the flow of subjects, most of the dimensions were measured on a hand measuring board. The actual measuring procedure is shown in the illustrations beginning on next page.

**THE MEASURING BOARD**

(1) The data sheet was inserted and clamped onto the measuring board.

(2) After personal information was recorded, the subject's right hand was raised to an oath-swearin position;

(3) a plastic 6-inch ruler was attached to the wrist with Scotch double stick tape, one edge of the ruler on the most distal wrist crease;

(4) the subject's hand was placed, palm down on the measuring board with the upper edge of the ruler (wrist crease) as close to the guide line as possible and the five fingers on the guide lines between the slides. The data blank was marked at both sides of the wrist along the upper edge of the ruler;

(5) the slides were adjusted and tightened when they just touched the inter-digital webs;

(6) the position of the fingertips were marked on the data sheet by a pin hole or pencil mark;

(7) Wrist Breadth (dimension #37) was measured;

(8) the hand was again raised and all other caliper-measured dimensions (#1-2, 8-11, 13-14, 16-17, 19-20, 22-23, 25-26, 28-29, 32-33, and 35-36) were secured and recorded on the data sheet;

(9) hand and wrist circumferences (#3-7) were measured with a steel measuring tape and recorded on the data sheet;

- (10) the data sheet was then removed from the measuring board. Finger circumferences (#12, 15, 18, 21, 24, 27, 31, 34, and 37) were calculated and recorded.

The raw data was edited and summary statistics computed on an IBM 7040 electronic computer according to techniques and procedures developed by Mr. Edmund Churchill, Antioch College, and discussed by him in "Anthropometric Survey of Turkey, Greece and Italy," pp. 23-34 (ref. 12) and "Statistical Considerations," Chap. 3, in "Human Development," pp. 40-75 (ref. 22).

Contained on the following pages are the summary statistics for the 56 measured hand dimensions. The mean, standard error of the mean, standard deviation, standard error of the standard deviation, range, coefficient of variation, skewness, kurtosis, sample size, and selected percentiles are given for each dimension. The coefficient of variation is merely the standard deviation expressed as a percentage of the mean; thus  $C.V. = (100.0 \times SD/M) \%$ . The values of the listed measures of symmetry and kurtosis provide a basis for judging whether the shape of a distribution of data values resembles that

of the normal distribution. For the normal distribution, the measure of symmetry equals 0 and the measure for kurtosis equals 3. A distribution with values close to these will, in general, have a shape similar to that of the normal distribution. Conversely, values for these measures markedly different from 0 and 3 will usually indicate distributions which differ substantially from the normal one.

The measure of symmetry is computed as the third moment (the average value of the third powers of the deviations from the mean) divided by the third power of the standard deviation. The measure of kurtosis is the fourth moment divided by the fourth power of the standard deviation. In addition are presented comparisons of the sample by age, rank, and Corps; a correlation matrix, bivariate tables, and nomographs.

<sup>1</sup>Personal communication—Mr. E. Churchill, Antioch College.

\*The formula used presents an approximation of the joint circumference. The figure given will vary from the true circumference as the shape of the joint varies from that of an ellipse -- a = measured joint breadth; b = measured joint depth.

Although the differences of the means for each dimension between Corps are small, the probability of one group being so consistently larger, using the Sign Test (ref. Siegel, 3, 1956), is  $p. < .001$ . Thus, the Null hypothesis being rejected, age 21-30 Nurses have slightly larger hands than the same age group WAF.

## SUMMARY STATISTICS BY AGE GROUP

| <i>Dimension</i>   | <i>Age Group</i>    | <i>Mean</i> | <i>S.D.</i> |

## F-TZGER-TIPS EYEN HAND C-RUDXFERWEZUE

Bivariate Frequency Table for Hand Circumference; Fingertips Even and Hand Circumference; Metacarpale

r = .734 (for grouped data)

(All frequency values are expressed as percentages. Dimensions are in inches)

**BLANK PAGE**

## **SECTION VIII**

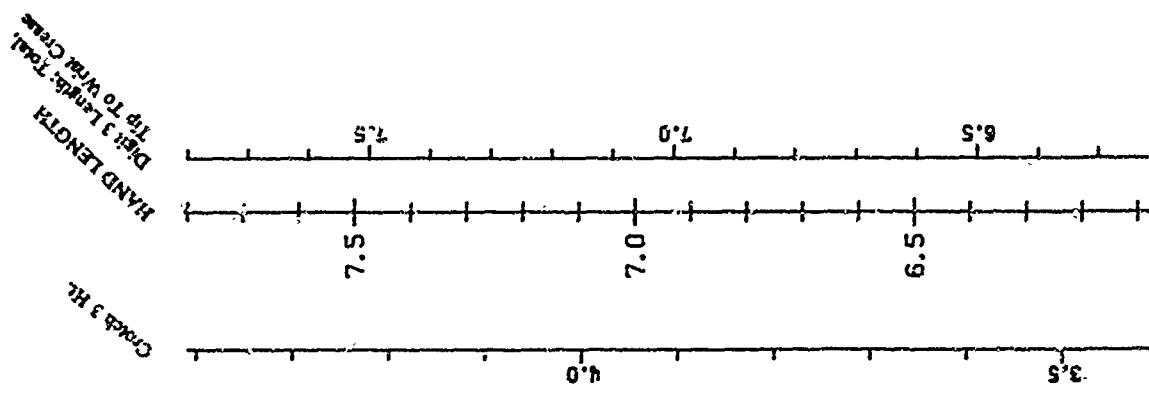

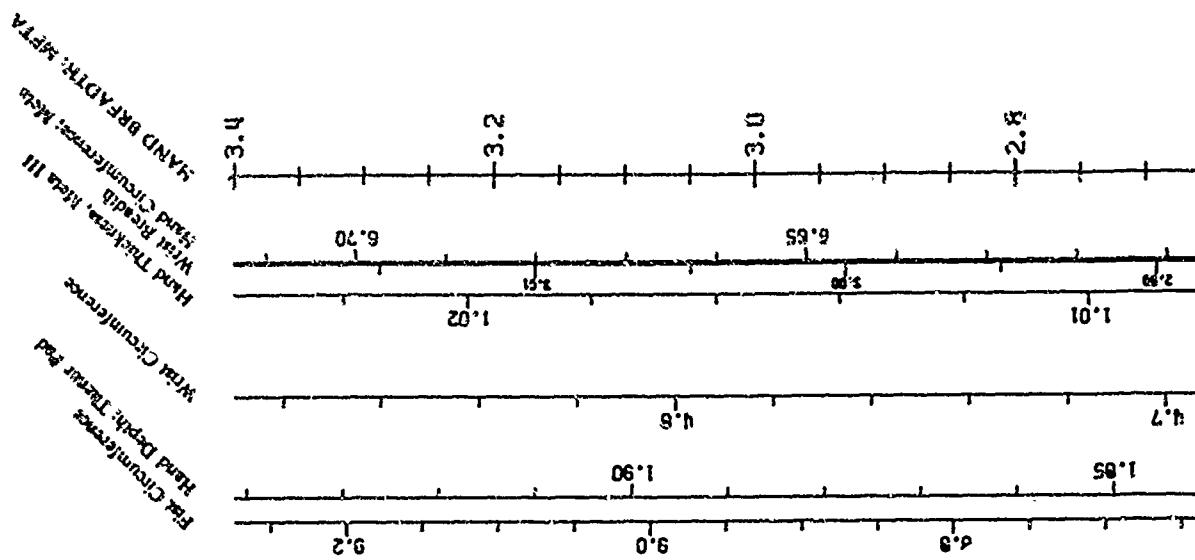

### **SELECTED NOMOGRAPHS**

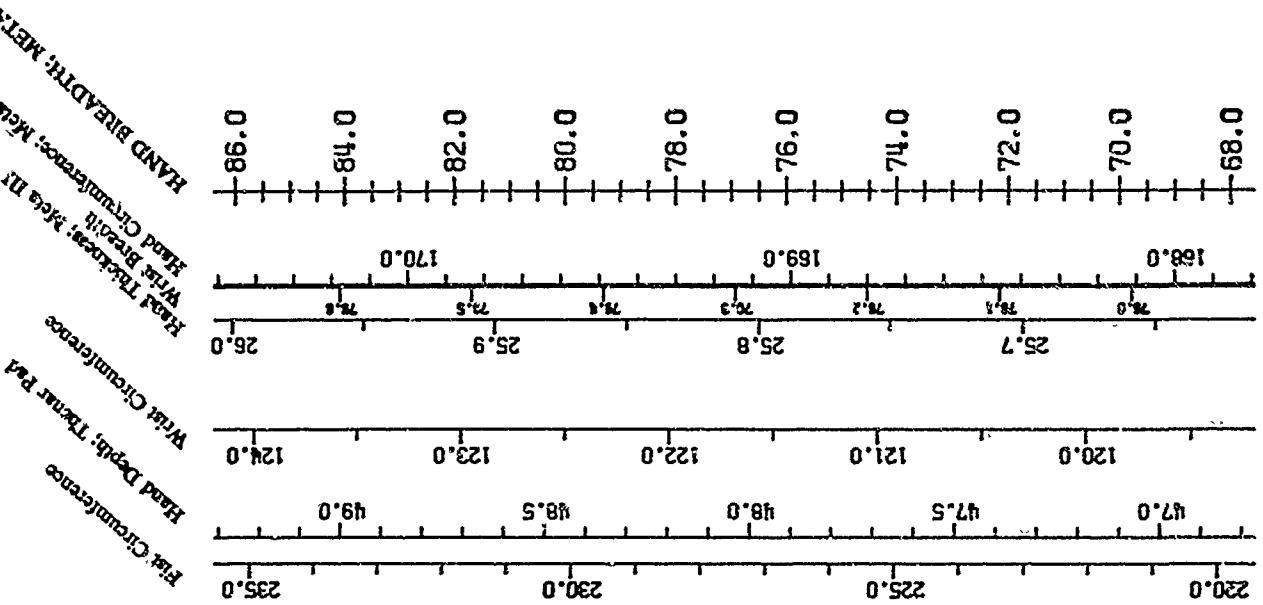

- 1. English Units of Measurement**
- 2. Metric Units of Measurement**

**USAF FEMALE PERSONNEL**

A straight line passing through known values of HAND LENGTH and HAND BREADTH, METACARPALE will also pass through average values of the other dimensions for USAF female personnel having this Hand Length and this Hand Breadth, Metacarpale. Each average value thus found is the midpoint of a range, found by adding and subtracting the number shown below the line to this midpoint, which will include the dimensions of about two-thirds of the women with the original values of Hand Length and Hand Breadth, Metacarpale.

All dimensions are in inches.

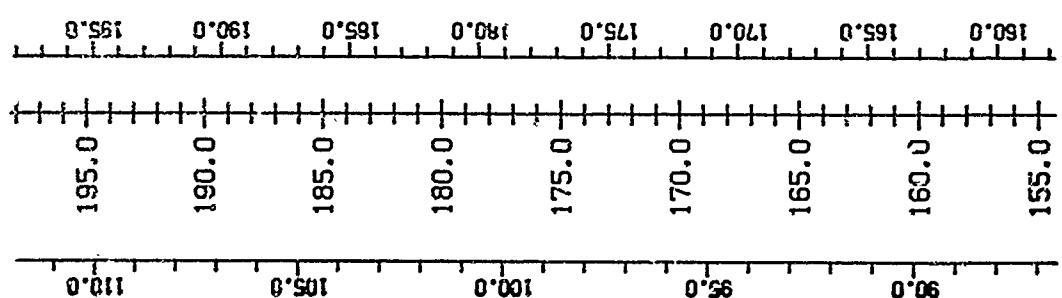

#### USAF FEMALE PERSONNEL

A straight line passing through known values of HAND LENGTH and HAND BREADTH, METACARPAL will also pass through average values of the other dimensions for USAF female personnel having this Hand Length and this Hand Breadth, Metacarpale. Each average value thus found is the midpoint of a range, shown by adding and subtracting the number shown below the line to this midpoint, which will include the dimensions of about two-thirds of the women with the original values of Hand Length and Hand Breadth, Metacarpale.

All dimensions are in millimeters.

| 13. ABSTRACT   |  |  |

This report describes 56 anthropometric dimensions measured on the hands of 211 Air Force female personnel (Women in the Air Force, Nurse Corps, and Biomedical Science Corps), aged 18-56. Summary statistics including the means, standard deviations, ranges, selected percentiles, measures of distribution, and coefficients of variation are presented for the 56 dimensions. Also included are statistical variations by age, rank and Corps within the sample, a complete correlation matrix, bivariate tables, and nomographs for various selected combinations of dimensions.
